Abstract (en)
[origin: US2012124758A1] A powered brush is provided comprising a plurality of automated bristles that are driven in order to facilitate application of shave cream to a user's face while raising hairs off the face and stimulating, exfoliating, lubricating and moisturizing the skin. The powered brush comprises a handle having a top end, a bottom end and a longitudinal axis therebetween. A brush head comprises a plurality of bristles projecting away from the top end in a longitudinal direction is attached to a brush cup which is disposed at the top end of the handle and is movable relative thereto. An internal mechanism couples a motor drive shaft to the brush cup. The internal mechanism translates rotational movement of the motor drive shaft to reciprocating motion of the brush cup causing the brush cup and corresponding brush head attached thereto to oscillate linearly in the longitudinal direction.
