Abstract (en)
[origin: US2012118678A1] A code strip has per meter a specific number of grid positions, which are provided in alternating sequence with openings and webs. A sensor can detect, for example, the travel direction of an elevator cage from the alternating sequence of the openings and webs. The code strip can be produced at, for example, the factory with alternating openings and webs per meter and adapted on site to the specific requirements of an elevator installation by breaking off the webs. Through breaking off the webs over a length a door zone, for example, is represented on the code strip.
