Abstract (en)

[origin: WO2012065972A1] The invention relates to an automobile air-conditioning loop (1) in which a refrigerant flows, the air-conditioning loop being capable of operating as a heat pump and including: a compressor (2); a first solenoid valve (4) connected to the compressor (2), to a radiator (8), and to an external heat exchanger (10), the radiator (8) being connected to the external heat exchanger (10) via a first pressure-release device (12) and to an evaporator (14) via a second pressure-release device (20), wherein the evaporator (14) is connected to the compressor (2), and the external heat exchanger (10) is connected to the compressor (2) and to the evaporator (14) via a second solenoid valve (22), characterized in that the external heat exchanger (10), the first solenoid valve (4), and the second solenoid valve (22) constitute a unitary part.
