Abstract (en)  
[origin: EP2432074A1] The component has two distant dipole ends (3) and a transfer foil that is prepared on a roller, where the transfer foil has a carrier foil and an electrically conductive transfer layer. A non-conductive substrate and an adhesive are formed, where structured creation of the adhesive is carried out on a substrate (1). The structure of the adhesive is applied such that the maximum distance of the dipole ends lies transverse to revolution direction. An independent claim is also included for an ultra-high frequency dipole-antenna system, which has a Radio frequency identificationtransponder.
