Abstract (en)

[origin: WO2012069373A1] For the near net shape manufacture of geometrically complex, high temperature resistant jet engine components that consist of an intermetallic phase a low-melting metallic phase which is present in a molten state or in a temperature range close to the molten state is mixed with a high-melting metallic phase which is present as a metal powder and the mixture is mechanically worked by subjecting it to shearing and kneading forces and heated in the process and its viscosity reduced. In a subsequent injection molding process the substantially near net shape jet engine component is shaped and optionally mechanically finished and is then subjected to a heat treatment to produce an intermetallic phase.
