Abstract (en)
[origin: WO2012070943A1] A snow slush wiper apparatus (1) is described. The snow slush wiper apparatus (1) is designed to be attached to a vehicle and to interact with the ground in order to remove slush from the road surface. The snow slush wiper apparatus includes a main frame (3) for attachment to the vehicle. At least one row of individual rubber blades (2) is secured to the main frame (3), and the row of rubber blades (2) extends lateral to the driving direction when in use, preferably angled relative to the driving direction. Each rubber blade (2) has individual, limited and resilient freedom of motion, said resilient motion tends to bring the rubber blade (2) back to a position of origin.
