Abstract (en)

[origin: WO2012069174A2] The invention relates to a tamping device for soil compaction, having an upper mass (1) with a drive and a lower mass (2) that can be moved relative to the upper mass (1) with a soil contacting element (3). In order to cause a working movement of the soil contacting element (3), a vibration generating device (6, 7, 8) is provided. In addition to the vibration generating device, a manipulating device (11), for example in the form of a damping body (12), is provided in an operatively connected manner between the upper mass (1) and the lower mass (2). The damping properties of the damping body (12) can be modifiable.
