Abstract (en)  
[origin: WO2012069869A1] This invention concerns a method for piloting at least one relay (101, 201, 301) on-board an automotive vehicle, comprising pulse width modulation means (6) adapted to control the holding power available for the relay. The pulse width modulation means (6) adjust the holding power to at least two intermediate and distinct levels inferior to a maximal value corresponding to the closing power of the relay (101, 201, 301), and superior to a threshold low value, on the basis of at least one parameter representing the state of the vehicle.
