Abstract (en)

[origin: EP2458885A1] The present invention may be deployed in a system comprising a Common Interface Conditional Access Module (CICAM) connected to a host device having a high definition display in which the CICAM and the host device communicate using a Common Interface Plus (CI+) Standard. A method and an apparatus are disclosed for using the CICAM to interactively control the display of high definition graphics on the host device's display by converting the high definition graphics into a subtitle track, sending the subtitle track from the CICAM to the host as part of the transmission stream including the audio video content, decoding the subtitle track and the video track in the host device and combining the resulting graphics for display. The generation of the high definition graphics in the CICAM is subject to user activity information fed back from the host to the CICAM.
