Abstract (en)

[origin: EP2645529A1] The method involves testing electrical magnitude of a circuit device using direct or indirect measurement, where LED branches (2) comprise LEDs (3) that are connected in series with a resistor (4). Constant electric current (I2) is injected as electrical signals in an operation and test mode, and voltage over the LED branches is measured. The LED branches are tested for efficiency of the LEDs under consideration in the operating and test state of measured voltages (U1, U2), where current intensity of another electric current (I1) is smaller than current level of the former electric current. An independent claim is also included for a circuit device.
