Abstract (en)

[origin: WO2012094467A1] Packaging configured to contain an item is made from a pre-formed plastic web from which a user-graspable tear tab extends to enable removal of the item from the packaging. Preferred embodiments each include a plastic web in the form of a pocket and positioned between front and back lidding sheets that have adhesive sections bonded together to form unitary packaging. The pocket is sized to pass through a pocket-receiving aperture in the front lidding sheet and retains and displays the packaged item. The tear tab outwardly extends from a peripheral flange from which the plastic web depends. A score line boundary formed in one of the front and back lidding sheets circumscribes or partly circumscribes at least a majority of the pocket receiving aperture and allows removal of the item by a user pulling the tear tab to tear open the packaging along the score line boundary.
