Abstract (en)
[origin: WO2012071596A1] The invention relates to a device for connecting reinforced concrete slabs (1) to a wall construction or ceiling construction (2) made of reinforced concrete, comprising an insulating body (3) for providing thermal insulation and a reinforcing part, which has closed loops (4') made of fiber plastic as tension reinforcing elements and bending pressure/shear elements (4'') having variable profiles made of ultra-high-strength concrete, wherein the horizontally arranged loops are supported in the insulating body between the reinforced concrete slab to be connected and the wall construction or roof construction and the bending pressure/shear elements are integrated into the insulating body.
