Abstract (en)
[origin: WO2012076645A1] The invention relates to a container with a rotary device for rotating an article in the container, in particular a stack of flat items of mail. The container (Beh) comprises a base (Bo), a supporting side wall (Abs-Sw) and at least one further side wall (Sw-geg). The rotary device comprises a first sheet-like retaining element (HE.1) and a second sheet-like retaining element (HE.2). These two retaining elements (HE.1, HE.2) are connected mechanically to one another. In a filling position of the rotary device, the first retaining element (HE.1) rests on the supporting side wall (Abs-Sw), and the second retaining element (HE.2) is located on the base (Bo). In a raising position of the rotary device, the first retaining element (HE.1) is located on the base (Bo). An article (St) located in the container (Beh) then rests on the first retaining element (HE.1). An article (St) can be moved into the container (Beh) when the rotary device is located in the filling position. The rotary device is then transferred into the raising position, this action rotating the article (St) in the container (Beh).
