Abstract (en)
[origin: WO2012075517A1] The invention relates to a switching device arrangement, comprising at least one switching device and a preferably dust-tight housing (2), wherein the switching device has a first operating element (3) and is arranged inside the housing, wherein the housing has at least one first housing part and one second housing part (5) connected to the first housing part preferably in a dust-tight manner, wherein a second operating element (7) is arranged on an outer area of the first housing part, and the second operating element is operatively connected to the first operating element at least indirectly by means of a third operating element. According to the invention, the third operating element is supported at least indirectly on a switching device housing of the switching device for the intended actuation and/or functioning of the switching device and/or for mechanically establishing a state of the switching device in a reliable manner.
