Abstract (en)

[origin: EP2650898A1] The method involves pushing a metal housing (4) forming a movable unit, inserting a pressure pin (5) into a pin guide. The pressure pin is pushed in a direction of a spring element until the pressure pin with an end is mounted at the spring element. The metal housing is displaced in a direction parallel to a mounting axis (36) and length of a free end portion (32) of the pressure pin is measured. The housing is fixed in a mounting position (33) at a plastic part, where the length of the free end portion corresponds to a preset value in the mounting position. An independent claim is also included for a temperature-sensitive electrical switch.
