Abstract (en)

[origin: CA2827525A1] The invention relates to a supporting device for a floor of a rail vehicle, having an elongate floor rail (1) which is divided into a plurality of longitudinal sections (2, 3), so as to form at least one joint, and is composed of a first metallic material, said floor rail being supported on a shell of the rail vehicle, which shell is composed of a second metallic material, wherein the floor rail (1) is connected in the region of the joint to an intermediate profile (6) which is provided for connecting in a flexurally rigid fashion the longitudinal sections (2, 3) of the floor rail (1) which adjoin one another, wherein a sliding seat is formed between the longitudinal sections (2, 3) of the floor rail (1) and the intermediate profile (6).
