Abstract (en)
[origin: WO2012079625A1] Openings (4) for accommodating individual cable strands (1, 1', 1'') pass through an anchor body (3), wherein the cable strands are anchored by anchoring means (5). A guide disk (8) provided with openings (9) is retained inside a socket pipe (6) at a distance from the anchor body. Guide pipes (10), in each of which a cable strand is guided, extend between the openings of the anchor body and the openings of the guide disk. The guide pipes have an elastic wall section (11) at least in the region of the outlet opening (7) of the socket pipe. Thus, transverse forces occurring in the cable strand due to deflection can be elastically absorbed and transmitted directly or indirectly to the socket pipe.
