Abstract (en)  
[origin: EP2653424A1] Provided is a call registration device of an elevator capable of appropriately canceling a call registration by voice input. For this purpose, the call registration device of an elevator includes a storage section which stores in advance predetermined destination registration vocabulary voice data representing destination floors and predetermined call registration canceling vocabulary voice data not including a destination registration vocabulary; a voice recognition section which makes a judgment as to whether or not an inputted voice matches voice data of the storage section; a voice call registration section which, in the case where an inputted voice matched the destination registration vocabulary voice data, outputs to an elevator control device a call registration request to a destination floor of the destination registration vocabulary which the voice matches; and a destination floor holding section which holds the most up-to-date destination floor of a call registration request outputted by the voice call registration section. In the case where within a period of time in which a cancellation is possible after the holding of the most up-to-date destination floor in the destination floor holding section, a voice of the call registration canceling vocabulary is inputted, the voice call registration section outputs to the elevator control device a request to cancel a call registration of the destination floor held by the destination floor holding section.
