Abstract (en)
[origin: WO2012085823A1] A household laundry washing machine has an oscillating assembly (10) that is supported by a structure (2) in a rotatable way, so as to be displaceable about a substantially horizontal axis of inclination (A) between at least one upright position, where the driving axis (B) of the laundry drum (14) is oriented substantially in a vertical direction, and at least one reclined position, where the driving axis (B) of the laundry drum (14) is oriented substantially in a horizontal direction. The control system of the machine (1) is configured for governing execution of at least one washing step when the oscillating assembly (10) is in the reclined position and for governing execution of at least one centrifugation step when the oscillating assembly (10) is in the upright position. The oscillating assembly (10) comprises a tank (42) for containing a volume of liquid necessary for execution of at least one rinsing step, and the control system is prearranged for governing execution of at least one rinsing step when the oscillating assembly (10) is in the upright position.
