Abstract (en)

[origin: WO2012084145A1] A method for determining a class reference data record for classifying documents of value, particularly bank notes, is proposed. The method has the following steps: a class reference image is created using a multiplicity of reference images of already classified documents of value in the same class; and a class reference data record having at least one class reference parameter is created using the class reference image. In this case, the pixel and intensity values of the respective pixel in the class reference image are a function of the pixel values of the relevant pixels in the multiplicity of reference images of already classified documents of value in the same class. For classifying documents of value, the method has the following further steps: at least one quantitative property of a document of value that is to be classified is determined; and the document of value that is to be classified is classified on the basis of a comparison between the quantitative property of the document of value that is to be classified and the class reference data record. A further subject of the invention is an appropriate apparatus (10).
