Abstract (en)  
[origin: EP2657384A1] A torchon lace machine capable of immediately taking treatments such as stopping the torchon lace machine, preventing a damage of rotor metals, reducing damages of various kinds of components transmitting rotation to the rotor metals, preventing a pattern disorder, when rotation errors occur at a spindle due to a collision of adjacent rotor metals caused by a timing disorder, getting caught of a working wear of an operator, getting caught of broken threads to the spindle, is provided. In the torchon lace machine according to the present invention, a transmission gear 6 transmitting a drive force from a motor drive part to a horizontal shaft 4 driving rotor metals 3 rotatably fitted to vertical shafts 2 in a horizontal direction is provided, in which the vertical shafts 2 are annularly disposed at a base 1 with a predetermined interval, an axial core part of the transmission gear is divided into a horizontal shaft transmission side and a motor drive part transmission side, a cam is formed at the divisional surface to make the motor drive part side move upward against a spring pressure for a load from the horizontal shaft side, and to be integrated for a load from the motor drive part side, and a sensor monitoring the moving upward of the transmission gear is provided.
