Abstract (en)

[origin: WO2012052533A1] The present invention relates to a device for controlling the locking of a vehicle door, comprising: first and second locking control elements (6) which can move between first and second control positions, and means for driving the control elements (6) between the first and second control positions thereof. The second control element (7) comprises a coupling member (10) that can also move between: a first coupling position, in which the coupling member kinematically interconnects the second control element (7) and a bearing member (5) of the driving means; and a second coupling position, in which the coupling member kinematically interconnects the second and first control elements and in which said coupling member authorises the first element (6) to be driven by the bearing member (5). The invention also comprises return means for returning the coupling member (10). The invention is suitable for motor vehicles.
