Abstract (en)

[origin: EP2660399A1] The operating device (1) has a motor (4) provided with an output element (5). The output element is connected loosely with a full flush lever (2) or a partial flush lever (3) during movement so as to provide movement of the flush levers against the gravitational force. The partial flush lever and the full flush lever are connected with each other through a coupling element (6) such that the movement of one flush lever driven by the output element is transferred onto the other flush lever that is uncoupled from the output element. An independent claim is included for a cistern arrangement.
