Abstract (en)
[origin: EP2662575A2] The membrane (6) is formed from an elastic material and has a working area (12) which is designed to deflect the membrane within a container. A fastening area (14) is provided, over which the membrane is fixed in the area of two joining areas of two container halves (2,4) to the container, so that the container halves are connected with each other over a positive connection. The fastening area has an adhesive layer that is set at one of the container halves or a connecting element (10). An independent claim is included for a container arrangement with an engagement area.
