Abstract (en)

[origin: WO2012095568A1] The invention relates to an apparatus including a housing (1) having a cover (2) and a pivotably mounted flap, said housing receiving a module (M) that receives the strip of precut material. Said module is arranged with a transverse supporting plate (6), and a flap (5) that is pivotably mounted relative to said module and to said supporting plate (6) while being placed in front of the latter and opposite the inner front surface of the cover so as to enable the material strip to pass therethrough. The module hingedly receives, in front of the flap, a cover plate (8) that is profiled, on the top edge thereof, with an edge (8.6), which is oriented toward the inside of the flap and which is suitable for projecting from the top of said flap so as to make it possible to guide the material strip between said flap and said cover plate. Said flap (5) and the cover plate (8) are arranged in a complementary manner on both sides of central notches (5.2) and (8.2), with one or more slots and one or more ribs that are capable of penetrating into said slot(s) when closing the cover, wherein the flap (5) and the transverse supporting plate (6) are coupled together so as to be limitedly pivotable such that the operator can access the inner space between the flap (5) and the cover plate (8).
