Abstract (en)
[origin: EP2664737A2] The present invention relates to a door hinge (1) comprising members that protect the first damper (9) and the second damper (14) in order to prevent the overloads that might arise when a household appliance door is closed fast from causing damage in the first damper (9) and the second damper (14). The door hinge (1) of the present invention prevents the door of a household appliance from making noise when being opened and closed, and slows down the fast movement during closing.
