Abstract (en)  
[origin: WO2012097809A2] The present invention relates to a spray head for dispensing product from a container, having ° an attachment element, on which is arranged a closure element for closing an outlet opening of a spray channel, and ° an actuating element, actuation of which allows the outlet opening to be connected to a valve opening of the container. In order to create a spray head which is easier, and more reliable, to handle than in the prior art, it is proposed within the context of the invention, that the closure element and the actuating element form a unit which can be pivoted about an axis from a closure position into an actuating position, wherein the outlet opening of the spray channel can be closed by the unit in the closed position, and that the unit has a blocking means, via which the unit can be blocked in the closure position.
