Abstract (en)
[origin: WO2012098001A2] The invention relates to a spool for receiving winding material, having a rotationally symmetrical, in particular conical, spool core (1) for receiving the winding material, wherein the spool core (1) comprises a first end (2) and one or more first catch areas (10), and a first flange comprising one or more first catch elements. In order to enable the first flange to be mounted on the spool core (1) as reliably as possible and with a simplified construction, one or more second catch areas (11) are provided on the first end (2) of the spool core (1) and one or more second catch elements are provided on the first flange, wherein the second catch areas (11) are formed on the spool core (1) and the second catch elements are formed on the first flange, such that the second catch elements engage with the corresponding second catch areas (11) when the first catch elements are engaged with corresponding first catch areas (10).
