Abstract (en)
[origin: WO2012080567A1] The spreader has a middle frame (10), at least one first telescopic arm (50) protruding in a first direction from the middle frame, in the end of which telescopic arm there is a first end frame (70), and at least one second telescopic arm (51) protruding in a second direction from the middle frame, in the end of which telescopic arm there is a second end frame (71). The end frames have gripping means (100) for gripping a container. The telescopic arms can be moved into a first position, where the distance between said gripping means of the first end frame and second end frame is at its shortest. In this position the end frames are at least partly underneath the middle frame, whereby they do not significantly increase the total length of the spreader. The middle frame and telescopic arms arranged in the middle frame can thus have been made longer, which increases the length of the telescopic arms in the protruding position and thus makes possible the handling of longer containers. In the first position the shortest distance between the gripping means of the first end frame and the gripping means of the second end frame can be smaller than the length of the middle frame. The spreader can be used to handle containers with a length of 20-48 feet.
