Abstract (en)

[origin: EP2666449A2] The bed (1) has a brake (43) comprising a locking position in which the brake blocks rotation of a rod (36) with respect to a foot bar (7), and a releasing position in which the brake allows the rotation of the rod. A movable pedal (47) is mounted between an inactive position in which the pedal maintains brake of a sloping device in a sloping position and a coupling lock (31) of the sloping device in a coupled position, and an active position in which the pedal releases the brake of the sloping device and places the lock of a proclive device (18) in a disconnected position.
