Abstract (en)  
[origin: EP2666938A2] The lock has lock housing in which a presser (3) is rotatably mounted along an operating axis (4). An operating arm (5) arranged on presser is movable between a closed position and an open position of a latch. A locking mechanism is arranged to release or block the latch depending on position of a movable bearing slide (10). A slide contact surface (11) of a movable bearing slide is moved with respect to a contact contour (8) of operating arm, during rotational movement of the presser.
