Abstract (en)
[origin: EP2669208A1] A clamp (1) for interconnecting two plate-like members (16, 17) so as to make them together form a substantially rectangular corner has two legs (2, 3) resiliently connected to each other and making an angle being less than 90° with each other in a rest state of the clamp. Each leg has at an outer end thereof remote to a transition (4) to the other leg a member (7, 8) configured to engage a part of the said plate-like member in an interconnecting state of the clamp. At least one of said legs is provided with an opening (11, 12) designed to receive an end of an elongated tool member in said interconnecting state of the clamp for enabling removal of said clamp in said interconnecting state from said plate-like members by influencing that leg in the direction apart from the other leg.
