Abstract (en)

[origin: WO2012104084A1] The invention relates to a moulding tool for producing a composite material part by coating, by means of a matrix, a flexible preform comprising a skin, and profiled elements delimiting a plurality of three-dimensional meshes of polyhedral shapes. This moulding tool comprises a mould and a counter mould made of a material having the same expansion coefficient as the preform. Furthermore, it comprises, for each three-dimensional mesh, a part for filling the latter, formed from a plurality of wedges (12-27) suitable for being interlocked and delimiting a free central volume (28, 29), and from a blocking part (40) suitable for ensuring a relative blocking of said blocking part and of the wedges (12-27), said wedges and blocking parts being produced from a material having an expansion coefficient suitable for obtaining a predetermined compaction of the preform for the polymerization temperature of the matrix.
