Abstract (en)
[origin: EP2671724A2] A two dimensional message delivery system is convertible into a three dimensional object. A die cut greeting card with sections of the greeting card die cut but still partially connected and creased so that they can be removed by the application of force from the card without the need for scissors or other cutting tools and which can be assembled by folding and engaging the die cut sections without the need for tape, glue or other connectors into a three dimensional object. It includes a die cut main two dimensional structural element, at least one die cut auxiliary two dimensional structural element, which connects with the main two dimensional structural element to form a three dimensional object, and a die cut additional message delivery element, which connects with the main two dimensional structural element to provide a messaging element to the three dimensional object.
