Abstract (en)

[origin: EP2672039A1] The device (100) has a portion (102) including a bearing surface (114) against an edge surface of a basin. Another portion (104) includes a support (120) for a roof element of a shelter. The latter portion is slidably mounted on the former portion between a retracted position in which the support is close to the bearing surface, and an extended position in which the support is spaced from the bearing surface, where a spring biases the latter portion towards its extended position. The support includes a curved edge (125) whose concavity is oriented opposite to the bearing surface. An independent claim is also included for a foldable shelter for a basin.
