Abstract (en)
[origin: WO2012108773A2] The present invention is based on known types of bindings, where it is provided a binding which can be used without a detachable calf support while retaining the ability of the binding to position the boot correctly in the binding. The fundamental principle is that one makes a detachable calf support which can easily be removed and adjusted, whereupon the binding will still be able to position the boot correctly in the binding without being adjusted forwards or backwards in any direction on the snowboard. The device preferably permits the detachable calf support to be re moved and replaced again without the use of tools. The invention also offers the opportunity of using different intermediate types of calf support.
