Abstract (en)  
[origin: WO2012130667A1] The invention relates to a device (V) for detecting the occupied or available status of a track segment (G), having a transmitter (S) for feeding in a transmitted signal (SIGS) into the travel rails (F) of the track segment (G) and at least one receiver (E) for receiving a received signal (SIGE) generated by transmitting the transmitted signal (SIGS) via the travel rails (F) of the track segment (G). In order to simplify commissioning, the device (V) is implemented according to the invention for varying the frequency of the transmitted signal (SIGS), for determining a resonant frequency of the transmitted signal (SIGS), and for adjusting the frequency of the transmitted signal (SIGS) to the determined resonant frequency. The invention further relates to a method for operating a device (V) for detecting the occupied or available status of a rail segment (G).
