Abstract (en)

[origin: EP2674519A2] The machine has belt pressure rollers (21) movably mounted in a region of double-twisting spindles (5). A compensation unit (24) i.e. pneumatic cylinder, is set on tangential belts (20). The pressure rollers are arranged around a pivotal axis in an oscillating manner. The compensation unit is attached to an adjustable compressed air feed circuit device that is arranged over a central power supply. A center arrangement of the belt pressure rollers is provided in spacing sections. A pneumatic controllable directional valve (50) is connected to the compensation unit.
