Abstract (en)

[origin: WO2012110431A1] The invention relates to a method for determining the load of a motor vehicle, comprising the following steps: detecting at least one physical measured variable that depends on the load and creating a measured value that represents said detected measured variable; evaluating the created measured values in order to determine the load by correlating the created measured values or the load values determined therefrom with each other in order to create a correction value from the correlation, with the aid of which an actual load value is determined for the load of the motor vehicle. The invention further relates to a system for detecting the load of a motor vehicle, and to a motor vehicle.
