Abstract (en)
A handy spur structure and more particularly to an improvement application of application No. 10002654.1, including: a spur main body, which is a curved rigid body adapted to a configuration of a heel section of a rider's shoe/boot, the spur main body having at least one post outward protruding from a middle section of the spur main body; and a soft and elastic lining member disposed on a portion of an inner circumference of the spur main body that is closer to a lower edge thereof. Multiple recessed/raised anti-slip stripes are formed on a surface of the lining member. The junction face between the spur main body and the lining member is outward upward inclined. The soft lining member is collectively disposed on a portion where the impact acts to minimize the possibility of peeling. Also, the spur structure is not liable to abrade the surface of a shoe/boot.
