Abstract (en)

The invention herein consists of adherent parts for composition and/or construction games. Parts can be made of wood or plastic, foam, EVA, fibreboard and can further be made of any other flexible material with adherent strips of material between them on a number of their sides. These parts have strips of adherent material on some of their edges which, as it is known, have small bristles or flexible hooks on one side and fibres on the other, such that on joining the side with the hooks to the side with the fibres they stick together by applying only light pressure, and when pulled, detach quite easily. This invention falls within the scope of construction games.
