Abstract (en)

[origin: WO2012103653A1] Techniques for absorbing or desorbing CO₂ include sizing enzymatic particles in accordance with the reactive liquid film thickness (drf) of the reaction medium to increase enzymatic catalysis of the CO₂hydration or dehydration reaction. Absorption may include contacting a CO₂ containing gas with an aqueous absorption mixture and determining (drf) of the C₂O₂ hydration reaction, wherein (drf) = (d?) / Ha where Ha₂ = (k₁.Dco₂/(kL)₂, Ha > 2 and k₁ = k₂Cab, k₂ being the CO₂ hydration kinetic constant in the mixture and Cab being the concentration of the absorption compound. The mixture may be under conditions that provide(dr) that is smaller than the liquid film thickness (d?) through which mass transfer of the CO₂occurs. The size ratio of the enzymatic particles and(dr) enhances enzymatic catalysis. Various implementations including processes, systems, formulations and kits are provided.
