Abstract (en)

A container for storing articles. The container comprises at least a bottom wall and a number of side walls which are pivotally connected to the bottom wall. The side walls can pivot from a closed position of the container, in which access to the bottom wall is limited, to an unfolded position of the container, in which access to the bottom wall is easier. Each side wall is provided, at a position spaced from the bottom wall, with an edge element which extends substantially transversely to the side wall. The container is provided with a flexible holder element which is connected to the edge elements. In the unfolded position, the flexible holder element extends over the bottom wall, the side walls, between adjacent side walls and between adjacent edge elements.
