Abstract (en)

[origin: EP2679919A2] The method involves maintaining cold water (KW) that is mobilized at tap connections (Z1-Z3), over a cold water circulation (KWZ). Hot water (WW) mobilized at the tap connection is maintained over a hot water circulation (WWZ). The cold water circulation is joined with the hot water circulation. The cold water is supplied from the cold water circulation into the hot water circulation while simultaneously adjusting the supply of a fresh cold water into the cold water circulation from a fresh water connection (3A) such that temperature of the cold water in the cold water circulation is lowered. An independent claim is also included for a drinking water device for supplying cold and hot water into a drinking water supply system.
