Abstract (en)  
[origin: EP2682671A2] The module (10) has a secondary optics device (30) projecting source light segments in a light beam distribution unit such that the distribution unit includes light beam segments that are attached to the source light segments. Two primary optics devices (18, 22) are designed as optical imaging devices such that LEDs are reproduced as a real intermediate image on an intermediate image surface. The secondary optics device is arranged such that the intermediate images of source light segment-emitting LEDs are projected as the assigned light beam segments of the distribution unit.
