Abstract (en)
[origin: WO2012045702A1] The device (1) for manually controlling the unlocking and locking of the lock of a frame, comprises at least one handgrip element (2), at least one support (3) which is hollow in the direction of its longitudinal axis (L) and suitable for supporting the handgrip element (2), at least one fixed plate (4) for bearing said support (3), and a control rod (6) of an unlocking and locking mechanism of the lock, disposed through said plate (4) and coaxially engaged with said support (3), there being envisaged at least one configuration of the control device wherein said handgrip element (2), the support (3) and the control rod (6) integrally rotate around a common rotation axis coinciding with the longitudinal axis (L), the device comprising first removable clamping means suitable for preventing the axial slipping of said support (3) from said control rod (6), and second removable clamping means for preventing the axial slipping of said handgrip element (2) from the support (3), said first clamping means being of the rapid clamping type, said second clamping means being of the rapid clamping type.
