Abstract (en)
[origin: WO2012123073A1] The invention relates to a system for changing a locking state of a window and/or a door, comprising at least one handle housing that can be connected in a rotationally fixed manner to the window and/or the door and a handle that is rotatably mounted relative to the handle housing. The invention further comprises at least one electronic evaluation circuit for detecting the position of the handle, wherein the evaluation circuit is provided with at least one printed circuit board arranged, at least in part, inside the handle housing and/or the handle, and accommodating a first sensor. The handle is connected in a pivotably secure manner to at least one connecting device, which extends through the handle housing, by way of which the locking state of the window and/or the door can be changed, wherein the printed circuit board is connected to the connecting device and/or the handle in a pivotably secure manner.
