Abstract (en)

[origin: CA2830207A1] Customers with an increased demand for technical gases are normally supplied with gas bottle packs. These are gas supply systems in which a plurality of commercially available pressurized gas bottles are connected to one another via a pipeline system which is simultaneously equipped with a connection for extracting gas and for filling the pack. Here, the fill pressure of the pack must correspond to the extraction pressure demanded by the customer. According to the invention, the pipeline system comprises at least two outlets which are designed in each case for different pressures, for example for 300 bar and for 200 bar. For this purpose, at least one of the outlets is equipped with a valve for pressure reduction. In this way, the extraction of gas at different extraction pressures is possible with one arrangement.
