Abstract (en)

[origin: EP2687666A2] The module (3) has a box (5) comprising an upper end (501), a lower end (502) and two side walls (51, 53) that are arranged opposite to each other. A guiding device (7) is provided for a sliding door and attached to the upper end of the box, where the guiding device forms an end of the box. The box has an opening (503) such that a free space (57) for retaining the door in the box is formed. A supporting element (6) is arranged in the box for supporting a tub-shaped seal, where a base of the seal lies on an inclination (26N) of a middle floor layer in an area of the opening. An independent claim is also included for a method for mounting a module for a sliding door.
