Abstract (en)
[origin: WO2012127299A1] The present invention relates to foundry binder systems forming a polyurethane that can be hardened with a catalytically effective amount of a hardening catalyst, comprising at least one phenolic resin component comprising at least: a phenolic resin and a solvent of triacetin type and a polyisocyanate component. The invention also relates to foundry mixes prepared from binder and an aggregate, foundry forms such as cores and moulds prepared by no-bake or cold-box processes, and also the respective processes. The foundry forms obtained by the present invention are in particular used for manufacturing metal parts, especially for casting metal parts.
